
Task 8 Report

Daily, Weekly & Monthly Sales Summary

Internship — Veda Technology

Task	Task 8 — Daily, Weekly & Monthly Sales Summary
Tool Used	Microsoft Excel (Google Sheets compatible)
Dataset	Sales dataset — 49 records, 6 fields (Date, Product, Category, Qty, Price, Amount), covering 1–21 August 2026
Submitted By	Akshat Srivastava

1. Task Description

Create a sales summary in Excel using **SUMIFS** to calculate daily, weekly, and monthly sales totals from a transaction-level dataset. The workbook also includes a verification note to confirm that the formulas produce the expected totals.

2. Objective

Build practical Excel skills for time-based sales analysis by converting raw sales transactions into daily, rolling 7-day weekly, and monthly summaries. The goal is to use formula-driven results that update automatically when the underlying data changes.

3. Approach

- Used the supplied sales dataset containing Date, Product, Category, Qty, Price, and Amount fields.
- Worked with 49 sales records dated from 1 August to 21 August 2026.
- Used the Amount field as the sales-value measure; the workbook contains transaction amounts such as Qty × Price.
- Created a separate Summary sheet with Date, Daily Total, Weekly Total, and Monthly Total columns.
- Applied SUMIFS with date criteria to calculate each day's sales total.
- Applied SUMIFS with a start date and an end date of Date + 6 to calculate a rolling 7-day weekly total.
- Applied SUMIFS with August 2026 date boundaries to calculate monthly sales; the sheet also includes a verification note for the overall monthly total.

4. Workbook Components

- **raw_sales_dataset.csv** — source sales transactions with product, category, quantity, price, and amount.
- **Summary** — formula-driven daily, weekly, and monthly sales totals for each date in the dataset.
- **Verification Note** — manual cross-check showing the 1 August total and the overall August total.

5. Key Outputs

- Total sales across the available dataset = **Rs. 67,100**.
- The highest single-day sales total was **Rs. 6,150 on 17 August 2026**.
- The 1 August daily total was **Rs. 3,250**, verified manually as 400 + 900 + 1,950.
- The first rolling 7-day total (1–7 August) was **Rs. 26,320**.
- The dataset contains four product categories: Accessories, Electronics, Home, and Stationery.
- Among categories, Electronics generated the highest sales value at **Rs. 23,600**, followed by Accessories and Home at Rs. 18,000 each.

6. Formula Logic

Summary	Purpose	Logic used
Daily Total	Sales for one date	SUMIFS on Amount where Date = the Summary date
Weekly Total	Rolling 7-day sales	SUMIFS where Date is between the Summary date and Summary date + 6 days
Monthly Total	Sales within August 2026 from each listed date	SUMIFS using August date boundaries; the first row represents the full-month total

7. Challenges Faced

- Date-based SUMIFS criteria require the correct combination of comparison operators and date references.
- The weekly calculation is a rolling 7-day window, so the start and end dates must move with each Summary row.
- Monthly calculations require consistent month boundaries so transactions are neither omitted nor counted outside the intended period.
- Formula verification was important: the workbook manually checked the 1 August calculation and confirmed the Rs. 67,100 monthly total.

8. Learnings

- SUMIFS can be used not only for category-based analysis but also for date-range sales analysis.
- Using cell references for date criteria makes the summary reusable instead of hard-coding every result.
- Rolling time windows are useful for monitoring sales trends across consecutive periods.
- A small manual verification step helps catch incorrect ranges or date criteria before submitting an Excel task.

9. Summary of Results

Metric	Result
Records analysed	49
Date range	1–21 August 2026
Total sales value	Rs. 67,100
Highest daily sales	Rs. 6,150 — 17 August 2026
First 7-day rolling total	Rs. 26,320 — 1 to 7 August
Top category by sales	Electronics — Rs. 23,600

10. Deliverables

- Task8_Veda_Technology.xlsx — Excel workbook containing the raw sales data and formula-based Summary sheet.
- Task8_Report.pdf — this report describing the task, approach, formula logic, outputs, challenges, and learnings.

11. Conclusion

Task 8 successfully demonstrates the use of Excel SUMIFS for practical sales reporting. The raw transaction data was converted into daily, rolling weekly, and monthly summaries, with verification checks included in the workbook. The resulting report provides a concise record of the analysis completed during the Veda Technology internship.
